GRE Introduction Workshop

g comprehension:

The nub of the restorationist critique of preservationism is the claim that it rests on an unhealthy dualism, conceives nature and humankind as radically distinct and opposed to each other. Dissatisfaction with this has for some time figured prominently in the not so happy writings of environmentalists with mainstream cultural society, as in the writings of Carolyn Merchant and Theodore Roszak. However, the writings of the restorationists themselves—particularly, William Jordan and Frederick Turner—offer little evidence to support this claim. In their view, preservationists are imbued with the same basic mind-set as the industrial mainstream, the difference being that the latter exalts humans over nature while the former elevates nature over humans. It is perhaps puzzling that Jordan and Turner do not see that there is no logic that requires dualism as a philosophical underpinning for preservation, more puzzling is the sharpness and relentlessness of their attack on preservationists, accentuated by the fact that they offer little, if any, criticism of those who have plundered the natural world.

The crucial question, however, about the restorationist outlook has to do with the degree to which the restorationist program is itself faithful to the first principle of restoration: that nature and humanity are fundamentally united rather than separate. Rejecting the old domination model, which sees humans as over nature, restoration theory champions a model of community participation. Yet some of the descriptions that Jordan and Turner give of what restorationists are actually up to—for example, Turner's description of humans as "lords of creation," or Jordan's statement that "the fate and well being of the biosphere depend ultimately on our relationship with it"—do not cohere well with the community participation model. Another holistic model—namely, that of nature as an organism—might be more serviceable to the restorationists. As with the community model, the "organic" model pictures nature as a system of interconnected parts. A fundamental difference, however, is that in an organism the parts are wholly subservient to the life of the organism. If we could look at the biosphere as a single living organism and could identify humans with the brain (or the DNA), or control it, we would have a model that more closely fits the restorationists' view.

However, to consider humans as the control center of the living earth is to ascribe to them a dominating role in nature. Is this significantly different from the old-fashioned domination model? In both systems humans hold the place of highest authority and power in the world. Also, neither view recognizes any limits to the scope and range of legitimate human manipulation in the world. This does not mean that there are no constraints; beneficial manipulation should be undertaken. But it does not mean that nothing is off-limits. A further parallel is that, because the fate of the world rests on humans, they must have a clear idea of what needs to be done.

The author's primary purpose in the passage is to

- (A) examine the similarities and differences among models for environmental philosophies
- (B) formulate a new philosophical model of the relationship between humans and their environment
- (C) critique a modern-day environmental philosophy
- (D) argue that one particular environmental philosophy is more workable than competing approaches
- (E) demonstrate the limited usefulness of models as the basis for environmental philosophies

Which of the following best expresses the function of the first paragraph in relation to the passage as a whole?

- (A) to establish the parameters of an ensuing debate
- (B) to identify problem areas within a school of thought, which are then explored in greater detail
- (C) to discuss secondary issues as a prelude to a more detailed examination of a primary issue
- (D) to provide an historical backdrop for a discussion of modern-day issues
- (E) to introduce opposing viewpoints, which are then evaluated

Which of the following models would the author most likely agree is least like the other models listed below?

- (A) domination model (B) holistic model (C) community participation model (D) dualist model (E) organic model

GRE Passage 1

Tocqueville, apparently, was wrong. Jacksonian America was not a fluid, egalitarian society where individual wealth and poverty were ephemeral conditions. At least so argues E. Pessen in his iconoclastic study of the very rich in the United States between 1825 and 1850.

Pessen does present a quantity of examples, together with some refreshingly intelligible statistics, to establish the existence of an inordinately wealthy class. Though active in commerce or the professions, most of the wealthy were not self-made but had inherited family fortunes. In no sense mercurial, these great fortunes survived that financial panic that destroyed lesser ones. Indeed, in several cities the wealthiest one percent constantly increased its share until by 1850 it owned half of the community's wealth. Although these observations are true, Pessen overestimates their importance by concluding from them that the undoubted progress toward inequality in the late eighteenth century continued in the Jacksonian period and that the United States was a class-ridden, plutocratic society even before industrialization.

1. Which of the following best states the author's main point?

- (a) Pessen's study has overturned the previously established view of the social and economic structure of early nineteenth-century America
- (b) Tocqueville's analysis of the United States in Jacksonian era remains the definitive account for this period
- (c) Pessen's study is valuable primarily because it shows the continuity of the social system in the United States throughout the nineteenth century
- (d) The social patterns and political power of the extremely wealthy in the United States between 1825 and 1850 are well documented.
- (e) Pessen challenges a view of the social and economic systems in the United States from 1825 to 1850, but he draws conclusions that are incorrect.

GRE Passage 2

Since the Hawaiian Islands have never been connected to other land masses, the great variety of plants in Hawaii must be a result of the long-distance dispersal of seeds, a process that required both a method of transport and an equivalence between the ecology of the source area and that of the recipient area. There is some dispute about the method of transport involved. Some biologists argue that ocean and air currents are responsible for the transport of plant seeds to Hawaii. Yet the results of flotation experiments and the low temperatures of air currents cast doubt on these hypotheses. More probable is bird transport, either externally, by accidental attachment of the seeds to feathers, or internally, by the swallowing of fruit and subsequent excretion of the seeds. While it is likely that fewer varieties of plant seeds have reached Hawaii externally than internally, more varieties are known to be adapted to external than to internal transport.

- 1) The author mentions results of flotation experiments on plant seeds (lines 5 – 6) most probably in order to:
- 1. Support the claim that distribution of plants in Hawaii is the result of long distance dispersal of seeds
 - 2. Lend credibility to the thesis that air currents provide a method of transport for plant seeds to Hawaii
 - 3. Suggest that the long-distance dispersal of seeds is a process that requires long periods of time
 - 4. Challenge the claim that ocean currents are responsible for the transport of plant seeds to Hawaii
 - 5. Refute the claim that Hawaiian flora evolved independently from flora in other parts of the world.

How to Become a Successful Programmer

kaj Maurya · Aug. 24, 17 · Agile Zone · Opinion

new awaits you, begin it here. In an entirely reimagined Jira.

programming is a field where interest is not enough to succeed. You have to be passionate, but also constantly learning more and more about programming. **Simply being interested in programming isn't enough to succeed** - we work like mad.

Programming is a profession with no limits, so to become a successful programmer you have to **think beyond the limits you've been told exist**. In the starting stages of a programmer's career, they'll face many challenges and some of them will give up, and only a very few will see the struggle through, do the hard work, and become a master in their field.

Steps to Becoming a Successful Programmer

Willingness to Learn New Technologies

What we have **learned and implemented** can quickly become obsolete as **technology is always changing**. So, as a programmer, you just have to **update your skills accordingly** and stay up to date. When a new technology comes on the market, it's typically made up of a few process and syntax changes, but **the changes are the same** so you can grasp it very fast.

Debugging Skills

Programmers **create code**, but when the software does not work as expected, the programmer should be able to **root out the problem quickly and effectively**.

Instead of making changes to all your code, **make a proper flow document while creating your code**, so that you can **investigate your code very quickly and find the issue as soon as possible**. By maintaining a proper document, you can debug your program quickly without wasting much time.

Solving Skills and Beyond

When a programmer gets a project/module, they just start coding. But successful programmers try to **understand the problem** first. One how the legacy database limits are solved with scalable SQL on distributed optimized compute providing breakthrough performance across data ingestion, transactions, and analytics in a single integrated platform. Sometimes after a project requirement is documented and the project is started, or even after it's completed, we get some issue in the project. So **find the issue before it arises**.

Also, find a way to solve the issue very quickly.

4. Passion for the Work

Your job time may be **nine to five** but when you have a passion for doing the job, don't just walk away when the workday is over. **Work until your work is done.** I don't mean to say that if you are not getting the solution then you should sit around frustrated the whole day, but if you're getting close, then just continue.

Your manager or the higher-ups will appreciate your work, and when you find a good environment your passion will increase.

Also, don't just sit around when there is no work. **Try to build some new application like a game, puzzle, chatting app, etc.,** which will help to make you more passionate about your work.

5. Grace Under Fire

Programming can be a stressful profession due to tight deadlines. And then there are those times we seem to get anything working. A poor programmer **just freezes up** and stops working. But a great programmer handles the stressful situation calmly and just keeps on working.

6. Laziness... I Mean Efficiency!

When there are a lot of tasks and time is **running out to complete your project**, then only the lazy programmer will find the better and quickest solution for completing the project because he knows very well how to work less and do more.

If you want to find the best way to do something then just ask the lazy person; chances are the lazy person will find the best, quickest, and most efficient way to do it because the **lazy person always tries to find more efficient way.**

7. Ability to Handle Failure

As a programmer, you will rarely have success on the first try, so failure is almost a certainty. So take this challenge rather than as a sign of defeat. Having patience and **persistence is very important to having success in programming.**

8. Willingness to Research

A programming language is just part of the picture. **A good and successful programmer always tries to make code which works for their employers and helps to solve business problems.** And, sometimes, requires you to do a little digging.

9. Teamwork Mentality

As you can see, you should work with a team because with the help of team members like the developers, analysts, and sales staff, you can achieve your desired results very effectively.

You will never meet your goals until you work with the team.

The Modern Database for Time Series, Real Time, and Beyond

See how the legacy database firms are being replaced by MemSQL on distributed optimized compute providing breakthrough performance across data ingestion, transactions, and analytics in a single integrated platform.

A Business Perspective

to work as a programmer in an IT company, but the **ideal programmer always focuses on business goals**. This allows you to move beyond just working on application ideas that get handed down from high. **Only a business focused programmer can suggest ideas** for a new project that may improve efficiency and operations.

know in the comments which point motivates you to become a successful programmer and if you like this article share it on social media so that every programmer can get the tips for becoming a successful career.

admaps, more flexible boards, and dozens of new integrations. And that's just the beginning.
